Intestinal Anastomosis Which Technique is Better?

Roseanna Lee March 1, 2012

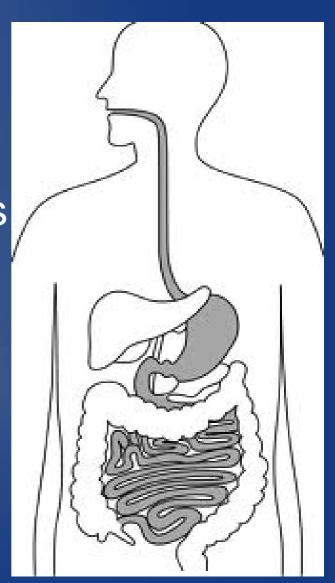

VS

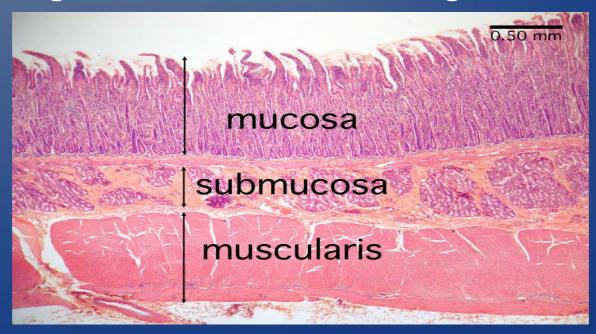

Gastrointestinal Anastomosis

- Provides continuity of the gastrointestinal tract
- Clinically apparent anastomosis leak rates ranges from 2-15%
- Complications associated with anastomotic breakdown increases morbidity and mortality

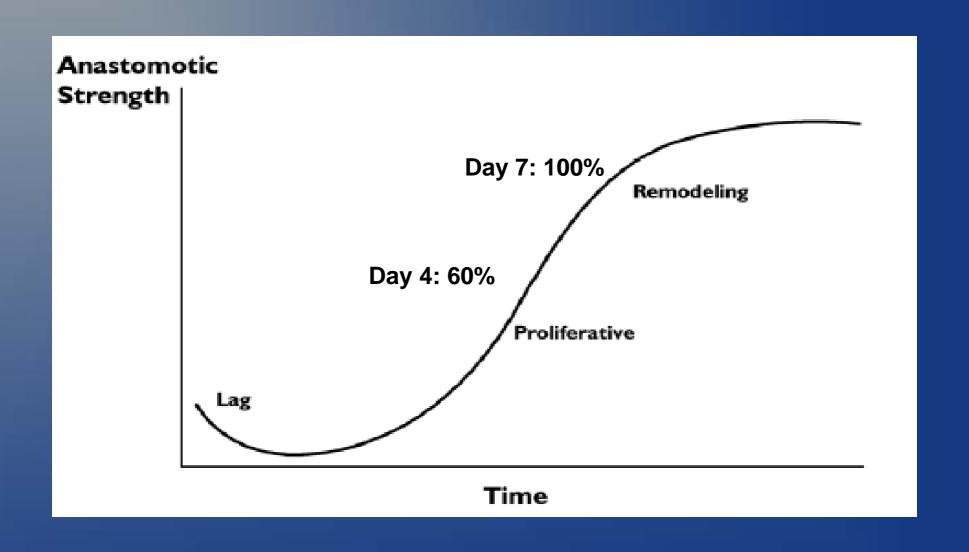

Histology

- Submucosal layer contains high content of collagen fibers which provides the the tensile strength of the bowel.
- Collagen is the most important molecule in determining intestinal wall strength

Healing Phases

- Acute inflammatory "lag" phase
 - Neutrophils and macrophages
- Proliferative phase
 - Fibroblast collagen synthesis in EC matrix
 - Matrix metalloproteinases (MMP) collagen degradation, increase with sepsis
- Remodeling/maturation phase

www.downstatesurgery.org Principles of Successful Intestinal Anastomosis

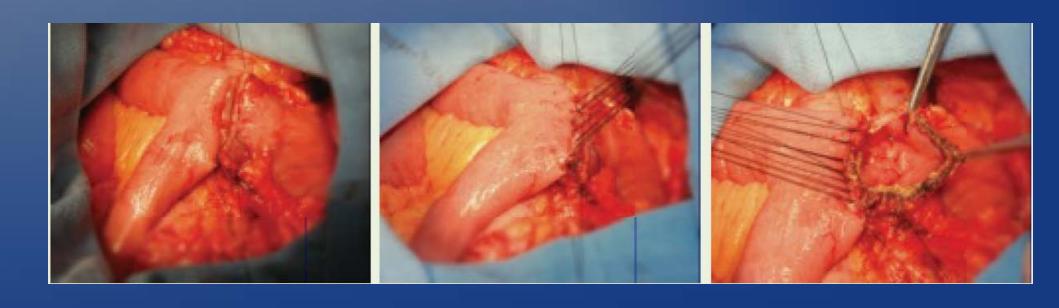

Technical Factors

- Adequate blood supply
- Tension-free
- Minimize contamination
- Meticulous technique

Patient-Related Factors

- Malnourished
- Chronic steroid use
- Diabetes mellitus
- Malignancy, prior chemoradiation
- Hypotension/Shock
- Emergency surgery

Hand Sewn Technique

Suture Material

 Ideal suture is one that elicits little to no inflammatory response while maintaining strength of the anastomosis during the lag

phase of healing

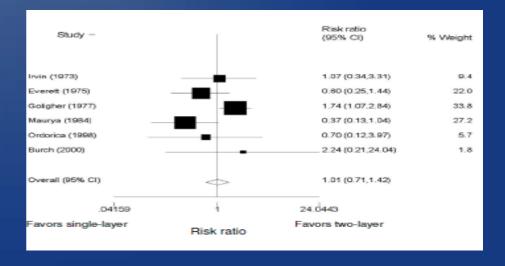

www.downstatesurgery.org Continuous versus Interrupted

- Sarin and Lightwood (1989) Br J Surg
- AhChong et al. (1996) Aust N Z J Surg
- Prospective studies comparing single-layer continuous and interrupted suture technique
- No significant difference

Single-layer versus Double-layer

- Burch et al (2000) Annals of Surgery
 - Compared single-layer continuous technique with two-layer interrupted technique
 - Prospective randomized trial
 - No difference in leak rates
 - Lower cost
 - Less time
- Shikata el al. (2006) BMC Surgery
 - Compared single versus two layer intestinal anastomosis
 - Meta-analysis of randomized controlled trials
 - No difference in leak rates.

Table 2. OUTCOME VARIABLES FOR THE STUDY GROUPS								
	One- Layer	Two- Layer	P					
Number of anastomoses Leaks Abscesses Time (min) Length of stay (days) Cost	65 2 (3.1%) 2 (3.1%) 20.8 7.9 \$4.51	67 1 (1.5%) 2 (3.0%) 30.7 9.9 \$35.38	.62* .0* .000† .084†					
* Fisher exact test. † Student t test.								

Staple Technique

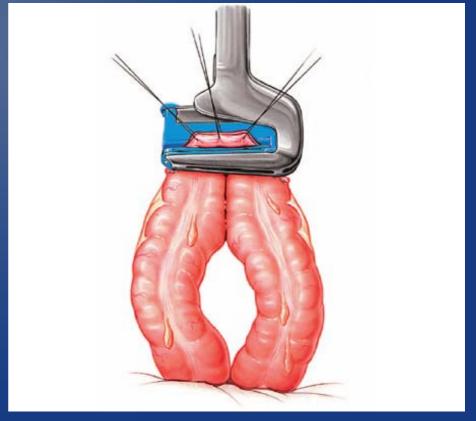

- Various stapling devices
- Staples come in various width, height, distance between staples
 - Each designed for specific tissues
- Open and laparoscopic uses
- Made of titanium minimal tissue reaction
- Nonmagnetic MRI compatiable

Transverse Anastomosis (TA) Stapler

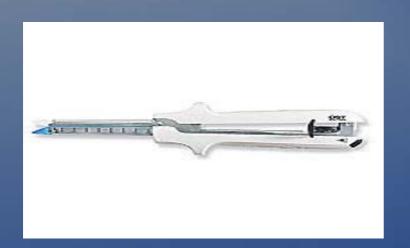

- 2 staggered rows of staples
- Does not cut

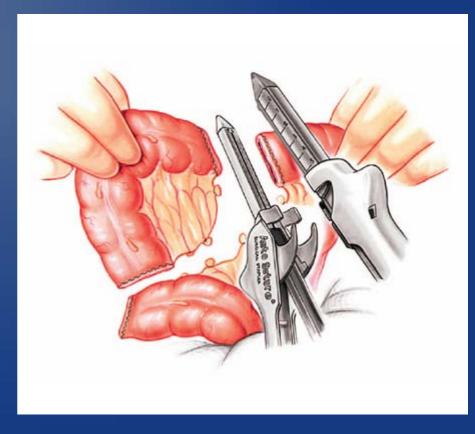

www.downstatesurgery.org Gastrointestinal Anastomosis (GIA) Stapler

- 2 double rows of staples
- Simultaneously cuts in between the rows

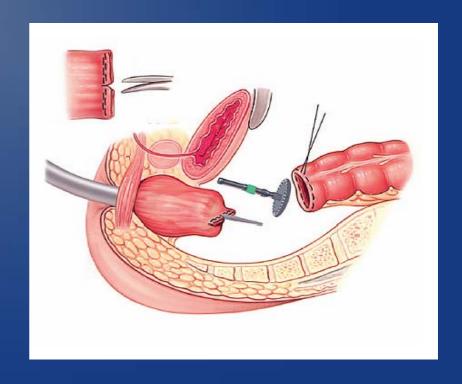

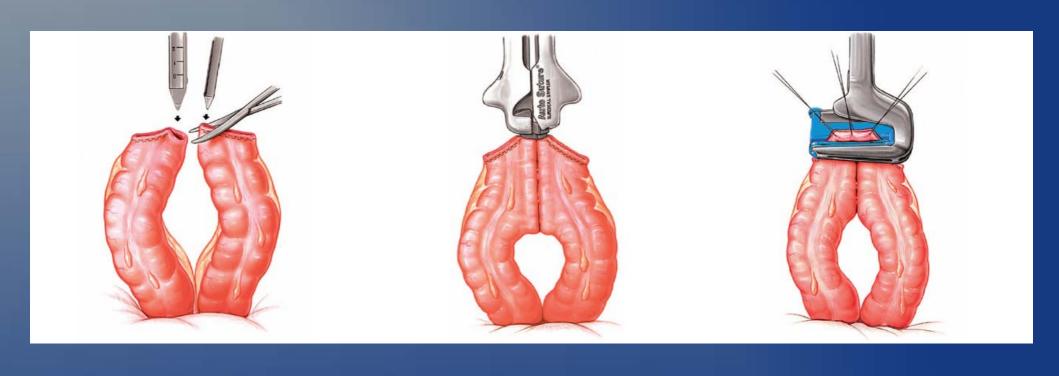

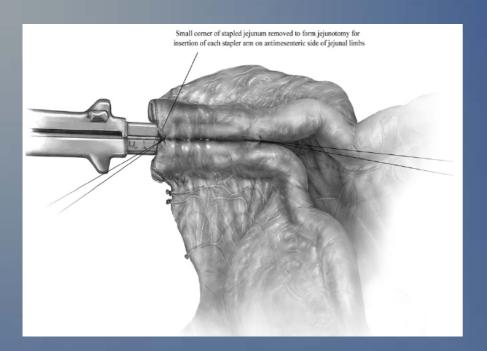

www.downstatesurgery.org End-to-end Anastomosis (EEA) circular stapler

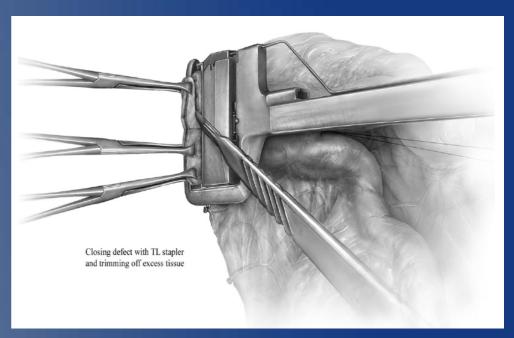

- Double rows of staples in circle
- Tissue cut within the circle of staples with cylindrical knife

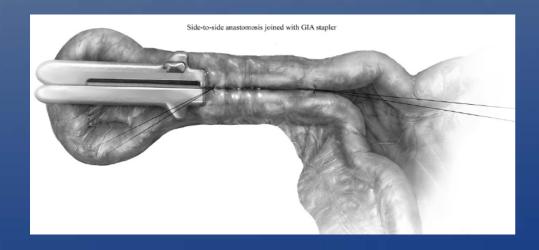

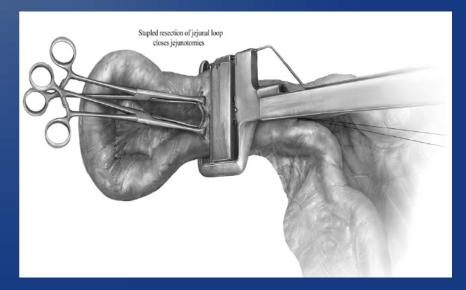

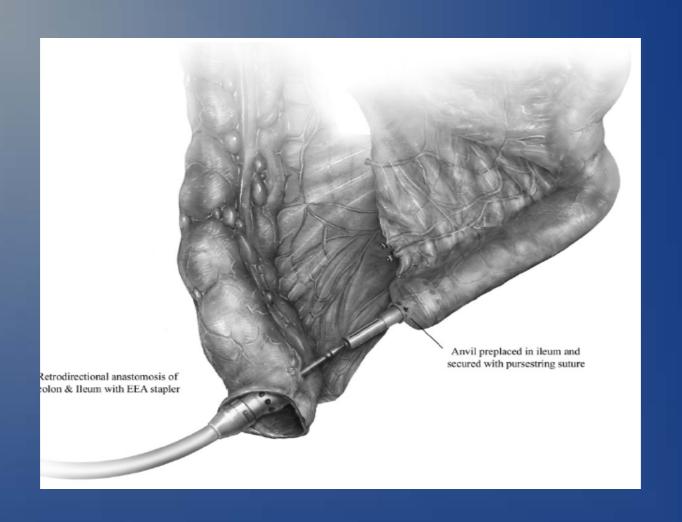

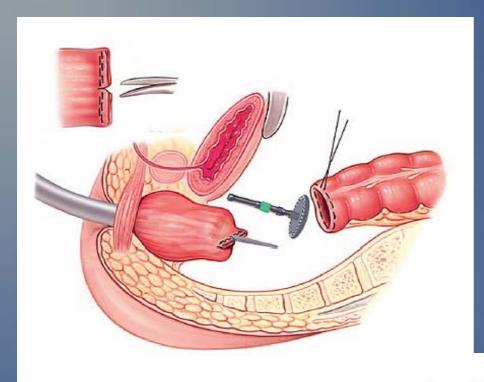

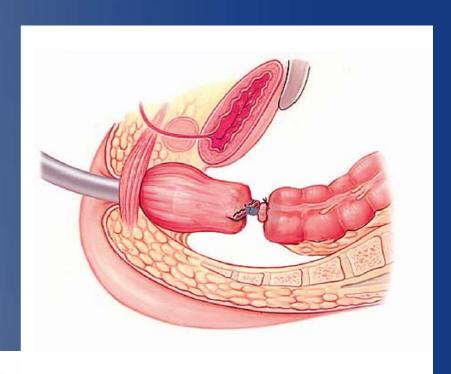

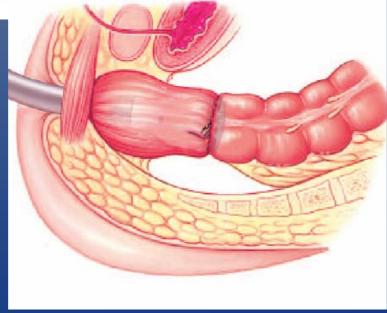

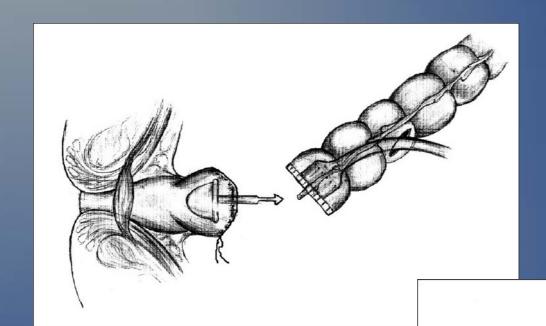

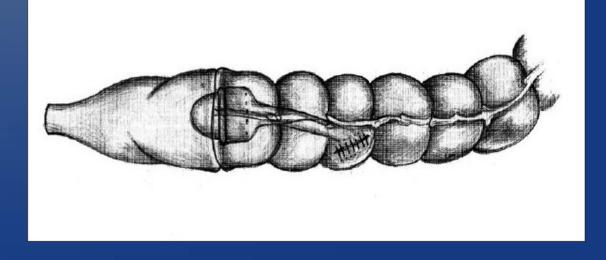

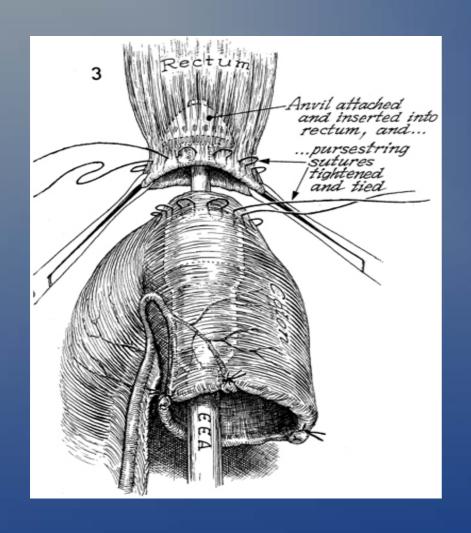

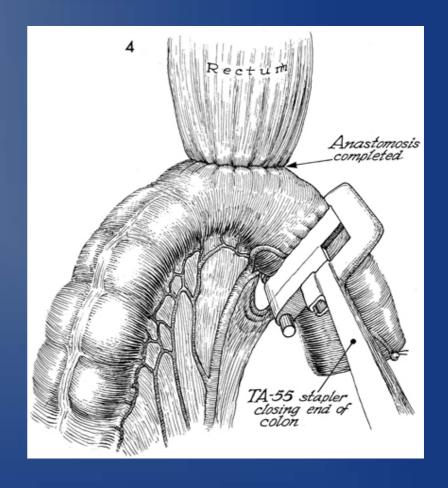

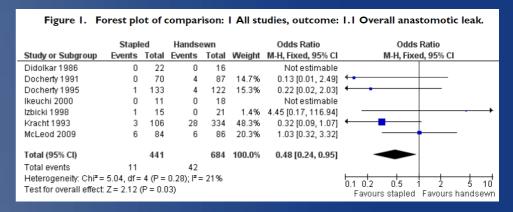

www.downstatesurgery.org Handsewn vs Stapled in Ileocolic Anastomosis

- Choy et al. (2011) Cochrane Review
- Stapled functional end-to-end ileocolic anastomosis is associated with fewer leaks than handsewn.
- Subgroup analysis of cancer patients showed leak rate of 1.3% vs 6.7% in stapled vs handsewn group.

www.downstatesurgery.org Handsewn vs Stapled in Colorectal Anastomosis

- Neutzling et al.
 (2012) Cochrane
 Review
- Insufficient evidence to demonstrate any superiority of stapled over handsewn techniques in colorectal anastomosis

www.downstatesurgery.org Handsewn vs Stapled Anastomosis in Trauma

- Demetriades et al. (2002) J Trauma
 - Prospective multicenter study of trauma patients that underwent colon resection with primary anastomsis
 - No significant difference between handsewn or stapled techniques

Handsewn

- Low cost
- Longer operating time
- Learning curve
 - surgeons experience
 - great variability

Staple

Expensive

Shorter operating time

Easy to learn

Little variabilty

Malfunctioning of device/Misfiring

Sutureless Compression Anastomosis

 Murphy's Button – introduced by Dr John Benjamin Murphy in 1892

Murphy Button The Murphy button, introduced by Dr. Murphy in 1892, was a major breakthrough in intestinal surgery. It allowed operations to be performed quickly and efficiently, reducing the risk of patient shock. The cap of each mushroom-shaped half was stitched to an intestinal opening and the stems were joined. As the sections of intestine healed together, the area directly attached to the metal button decayed, releasing it to be passed.

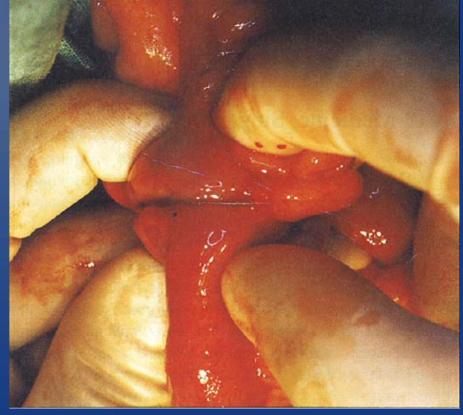

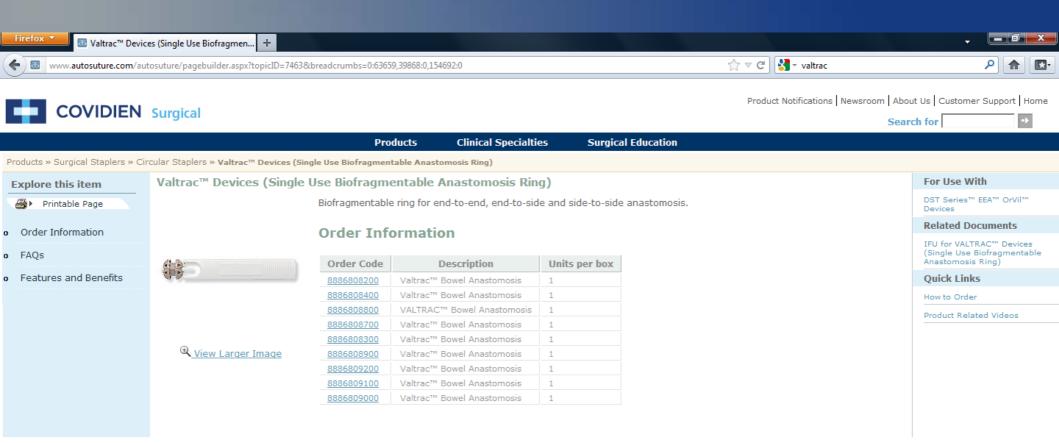

www.downstatesurgery.org Valtrac BAR (Biofragmentable Anastomosis Ring)

- Introduced in 1985 by Hardy et al
- Double-sgemented ring composed of polyglycolic acid and barium sulphate
